I feel that it would be an injustice to restrict xm to not carry the instant traffic and weather. As a truck driver i rely on the constant information that I get with my xm system. Local programming has to answer to sponsors and time frames and station objections to provide people with the traffic and weather; when they do provide the information it is in siplets and in broken time frame. To those of us that make large use of our xm systems we find that we can make better decisions ,quicker to make route changes, and etc... by having this information at a constant changing and updating rate.
